SUMMARY

Senior Backend engineer with 5+ years building multi-tenant platforms, event-driven systems, and EVM infrastructure. Led a 9-person team to ship a vulnerability-triage and threat-surface-management platform for banks at NST Cyber. Led a backend service split and architected multi-chain event-ingestion systems at Kleros. OSCP certified.

PROFESSIONAL EXPERIENCE

Kleros, Remote

Feb 2024 - May 2026

Backend Engineer

- Split a monolithic NestJS backend into separate API and bot services after surfacing conflicting scaling needs. Set up the monorepo and production data migration preserving user data
- Implemented Kleros v1's multi-network automation bot for dispute progression and juror staking; used viem for transaction simulation and batched calls to reduce gas usage
- Architected a NestJS EVM event ingestion service currently running on 3 production chains, with runtime configurable chain and contract definitions; emits events for async downstream processing
- Found 4 medium-severity issues in Kleros v2 arbitration contract through manual analysis. Applied Halmos formal verification and Echidna stateful fuzzing during the review

NST Cyber, Remote

Mar 2021 - Feb 2024

Software Engineer Team Lead

Jan 2023 - Feb 2024

- Led a cross-functional team of 9 building Assure v2, a multi-tenant vulnerability-triage and threat-surface management platform for multinational banks
- Owned design and development of Assure v2; selected TypeScript, NestJS, Angular, and Terraform, wrote ~70% of backend code, shipped in 6 months
- Moved the product off OutSystems, eliminating ~\$200K/year in platform costs while enabling 3-level tenancy, data residency, isolation modes, and white-labeling
- Architected Assure v2's authorization model using CASL.js: 5-role hierarchical RBAC plus ABAC (Attribute-Based Access Control), tenant isolation, and per-user project access
- Wrote Terraform for Assure v2's core AWS infrastructure, reducing deploys from ~2 hours to 10–15 minutes; introduced Cypress E2E tests, reducing full regression from hours to under 30 minutes
- Designed and implemented a multi-database connection-pool utility for Assure v2, reusing connections across logical tenant databases and physical country-level databases to eliminate per-request connection setup

Software Engineer

Mar 2021 - Jan 2023

- Built and took Assure v1 to production in OutSystems in ~3 months, writing most of the production code; the product later outgrew OutSystems tenancy and data-residency limits, triggering the v2 rebuild
- Developed Tigress's Django REST Framework backend from scratch; owned database design, authored most of the core APIs, and created a serializer abstraction adopted across most endpoints
- Resolved distributed-task bottleneck in Tigress scanning engine by restructuring Celery dispatch for cross-instance execution, reducing scan time by 50%
- Created an internal asset-discovery and vulnerability-scanning tool in Bash that chained security tools and generated client-ready reports. Tool's orchestration model later informed Tigress's scanning-engine design

CREDENTIALS

Offensive Security Certified Professional, OffSec

FEB 2017

SKILLS

Programming Languages: TypeScript, Python, JavaScript, SQL, Solidity

Databases: PostgreSQL, MongoDB, MySQL

Frameworks: Node.js, NestJS, Django REST Framework, GraphQL, React, Next.js, Viem

Infrastructure and Platform: AWS (Lambda, ECS, S3, RDS), Docker, Terraform, Celery, Kafka
